

# Corrected Figures

Kevin Kiley

12/15/2021

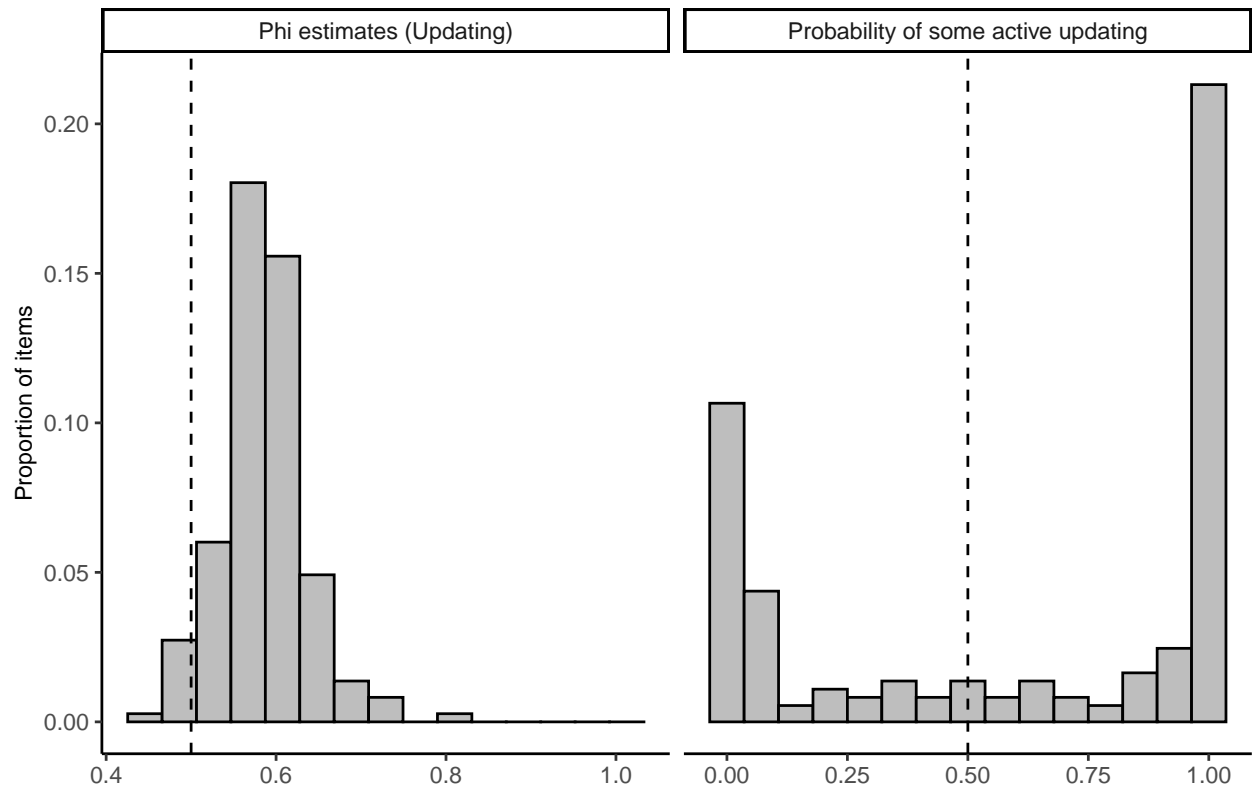

Figure 1: Distribution of phi estimates and probabilities that items show evidence of active updating.

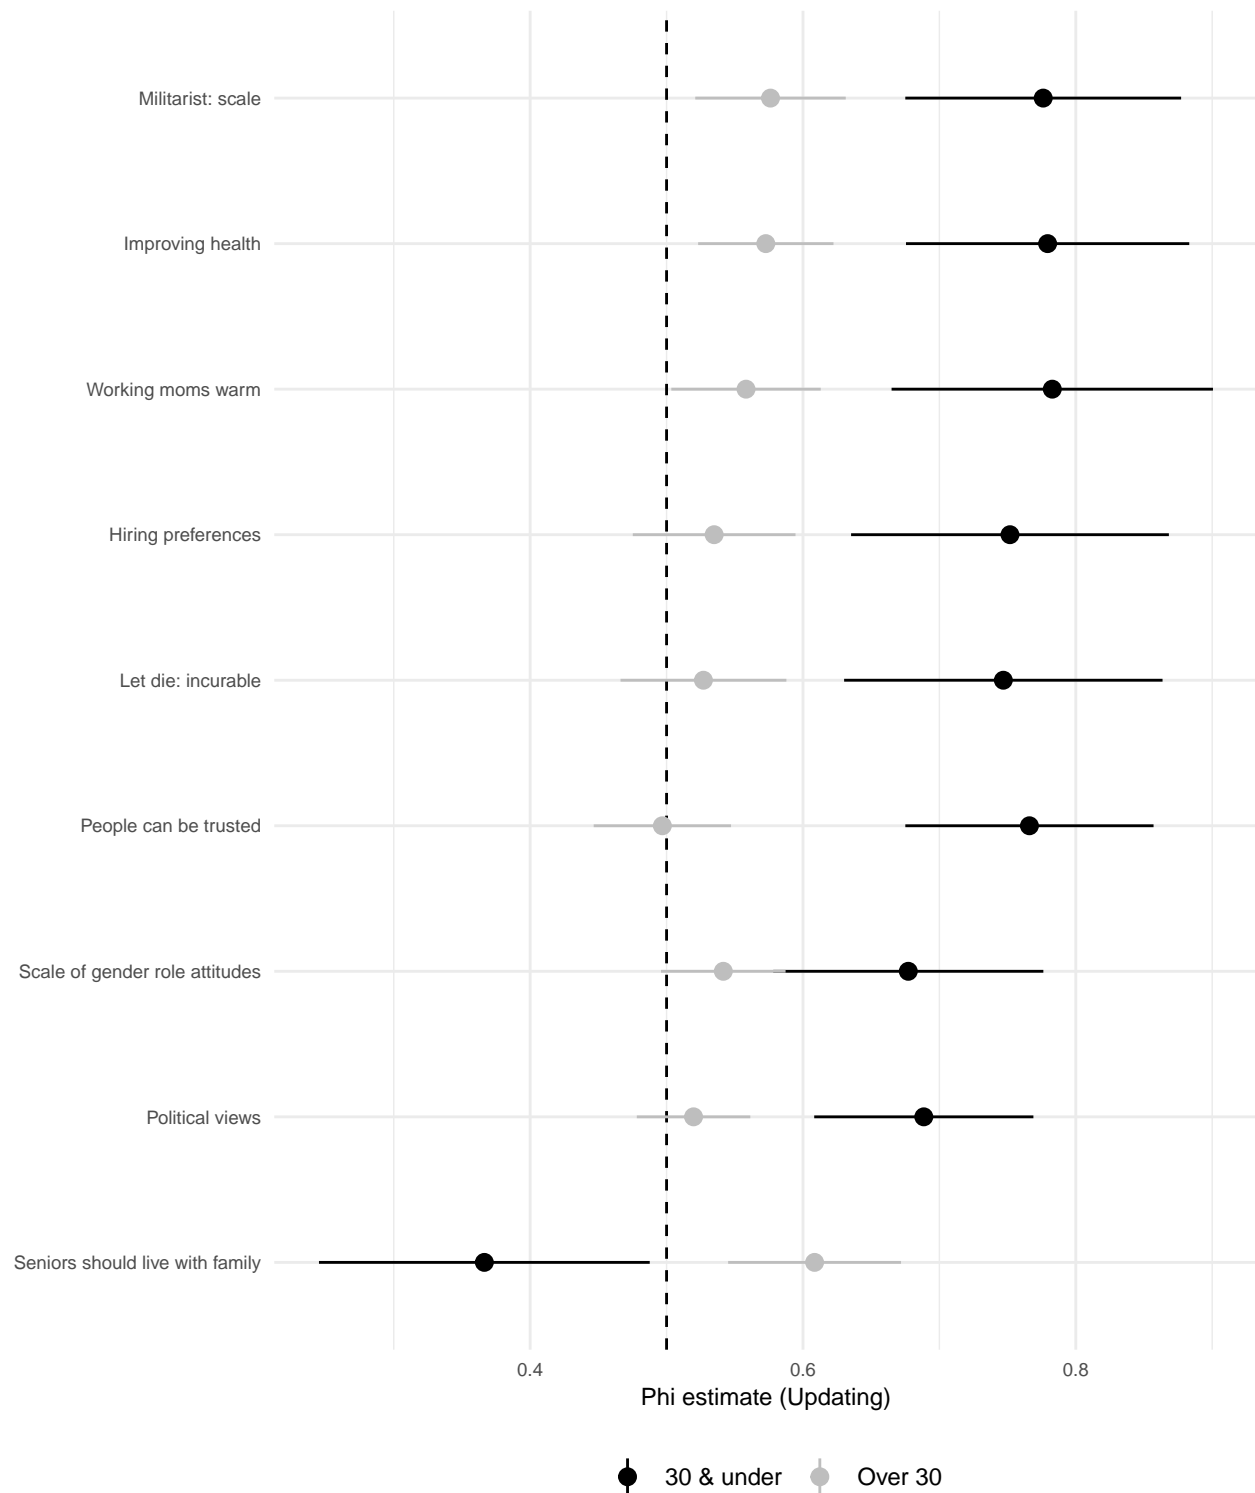

Figure 2: Comparison of phi estimates for individuals over and equal to or less than 30 years old, with 95 percent confidence intervals.

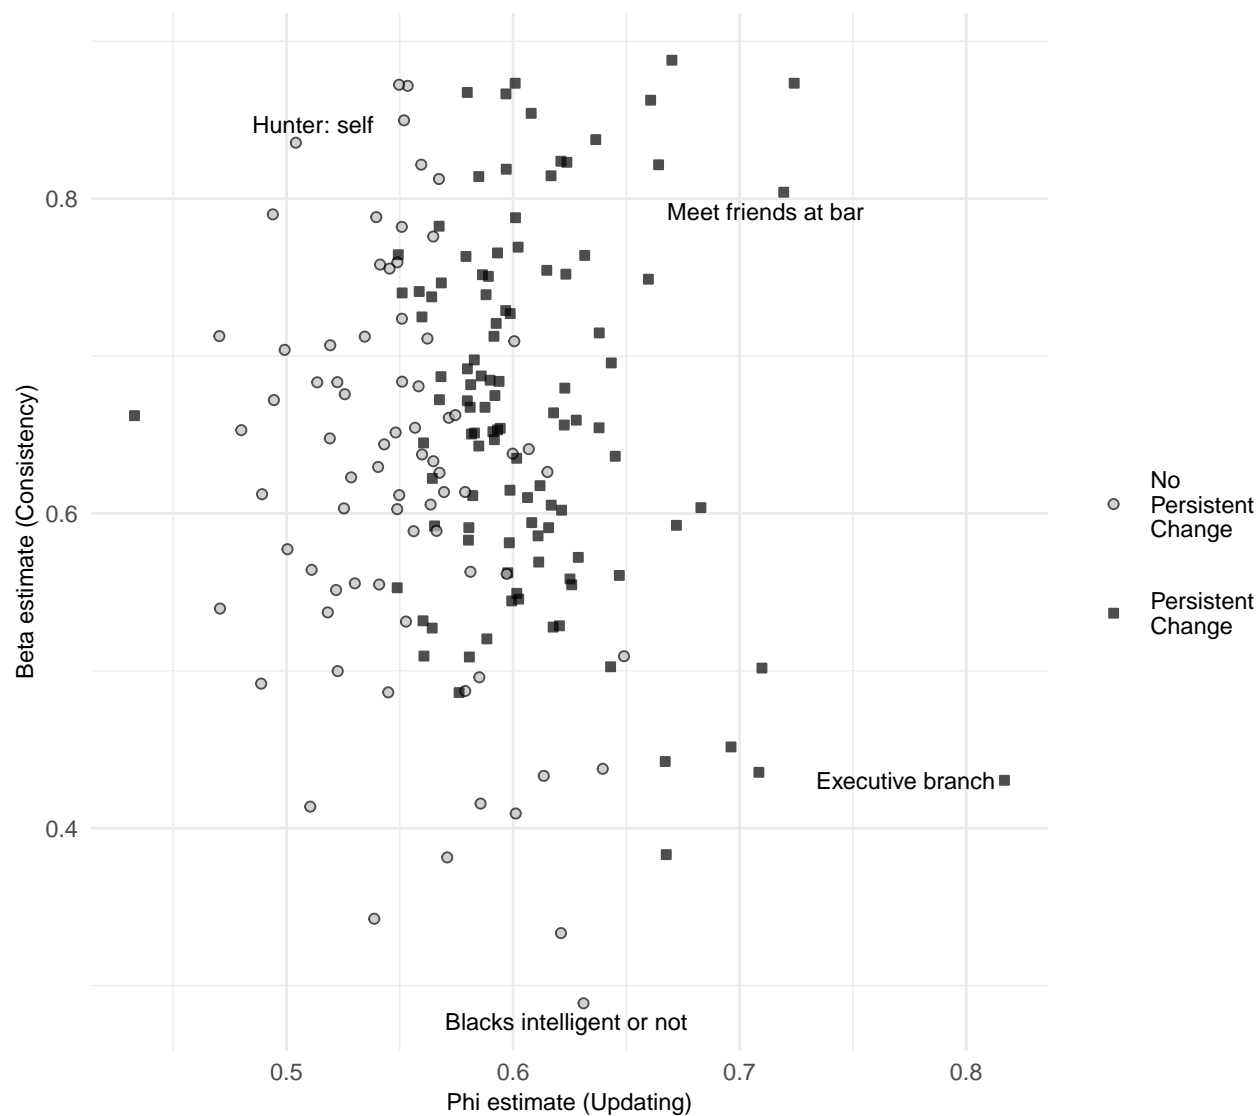

Figure 3: Distribution of beta and phi estimates for GSS items, by whether model prefers  $\phi = .5$  constraint.

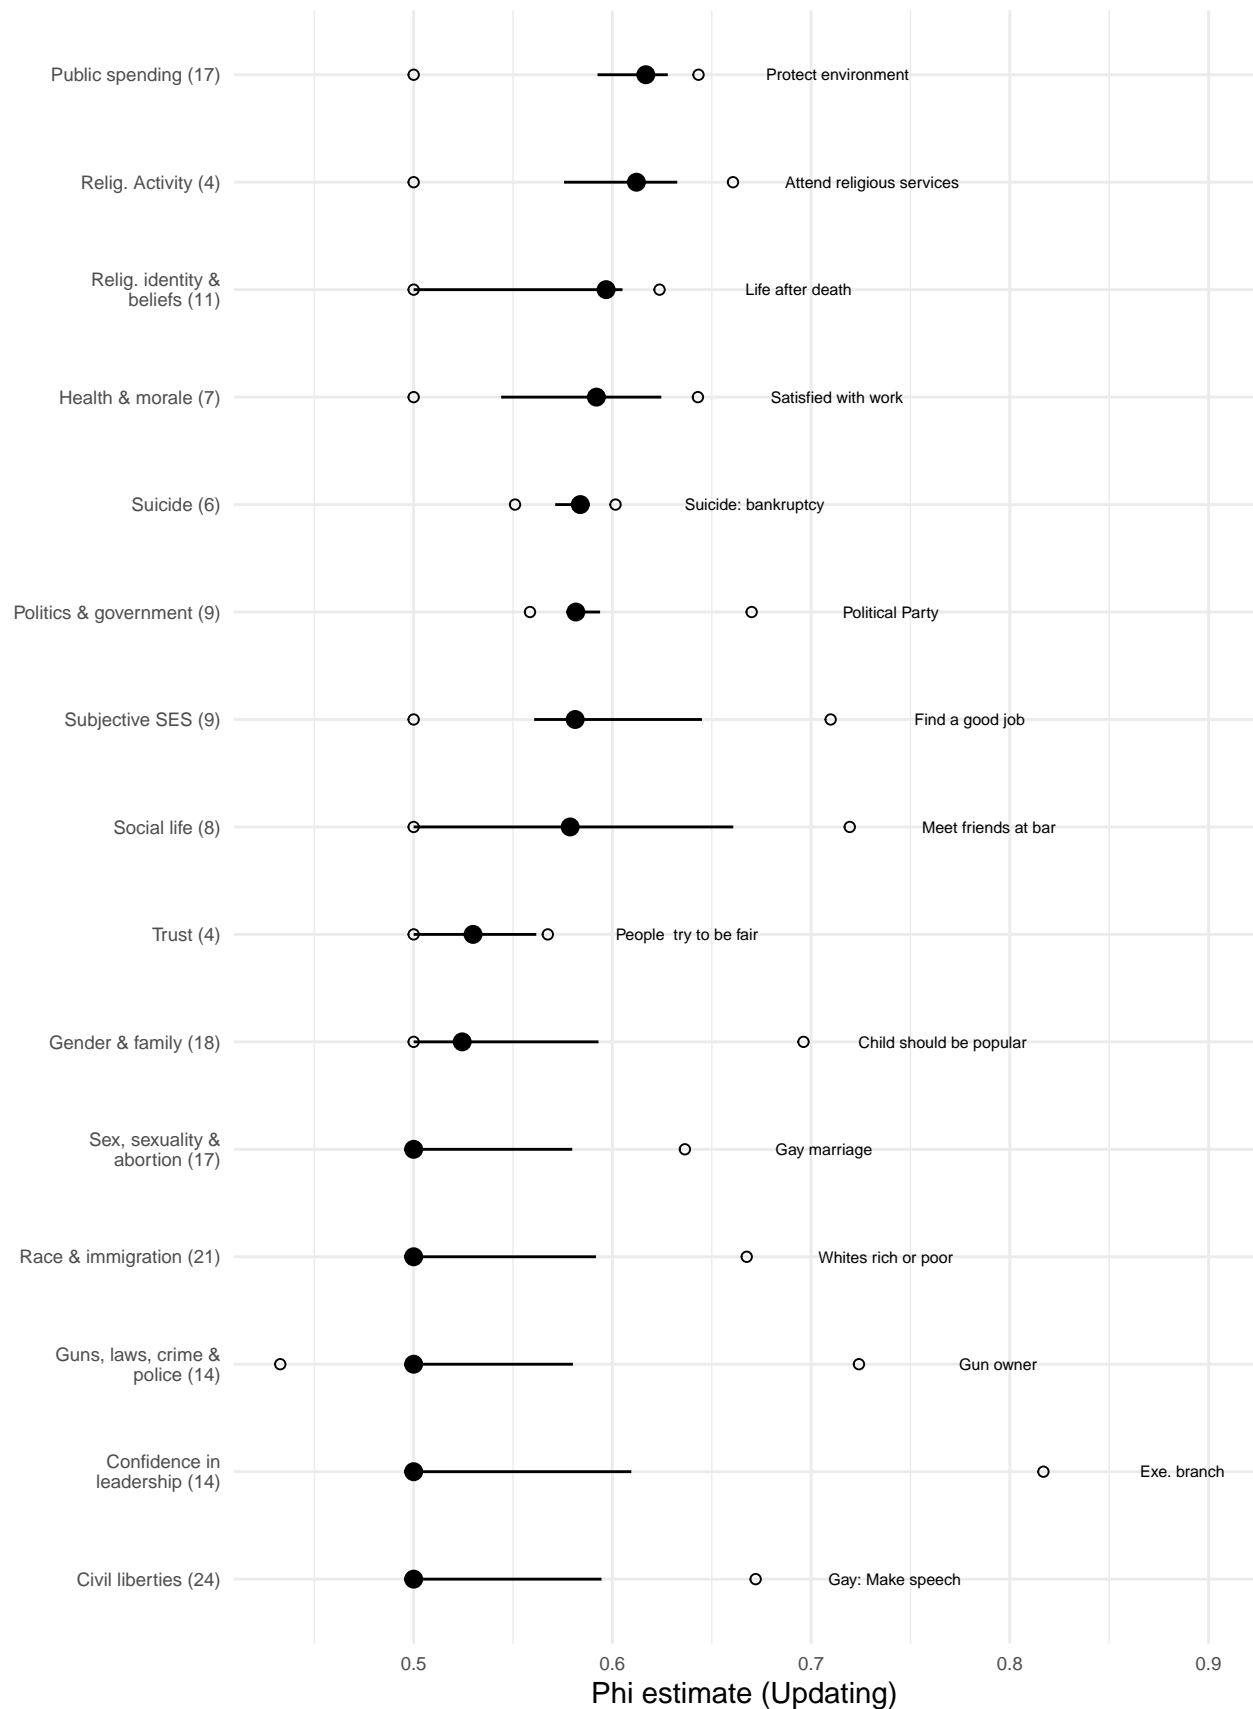

Figure 4: Summary of phi estimates for all items, by topical group. Numbers in parentheses indicate the number of items in each topical group.

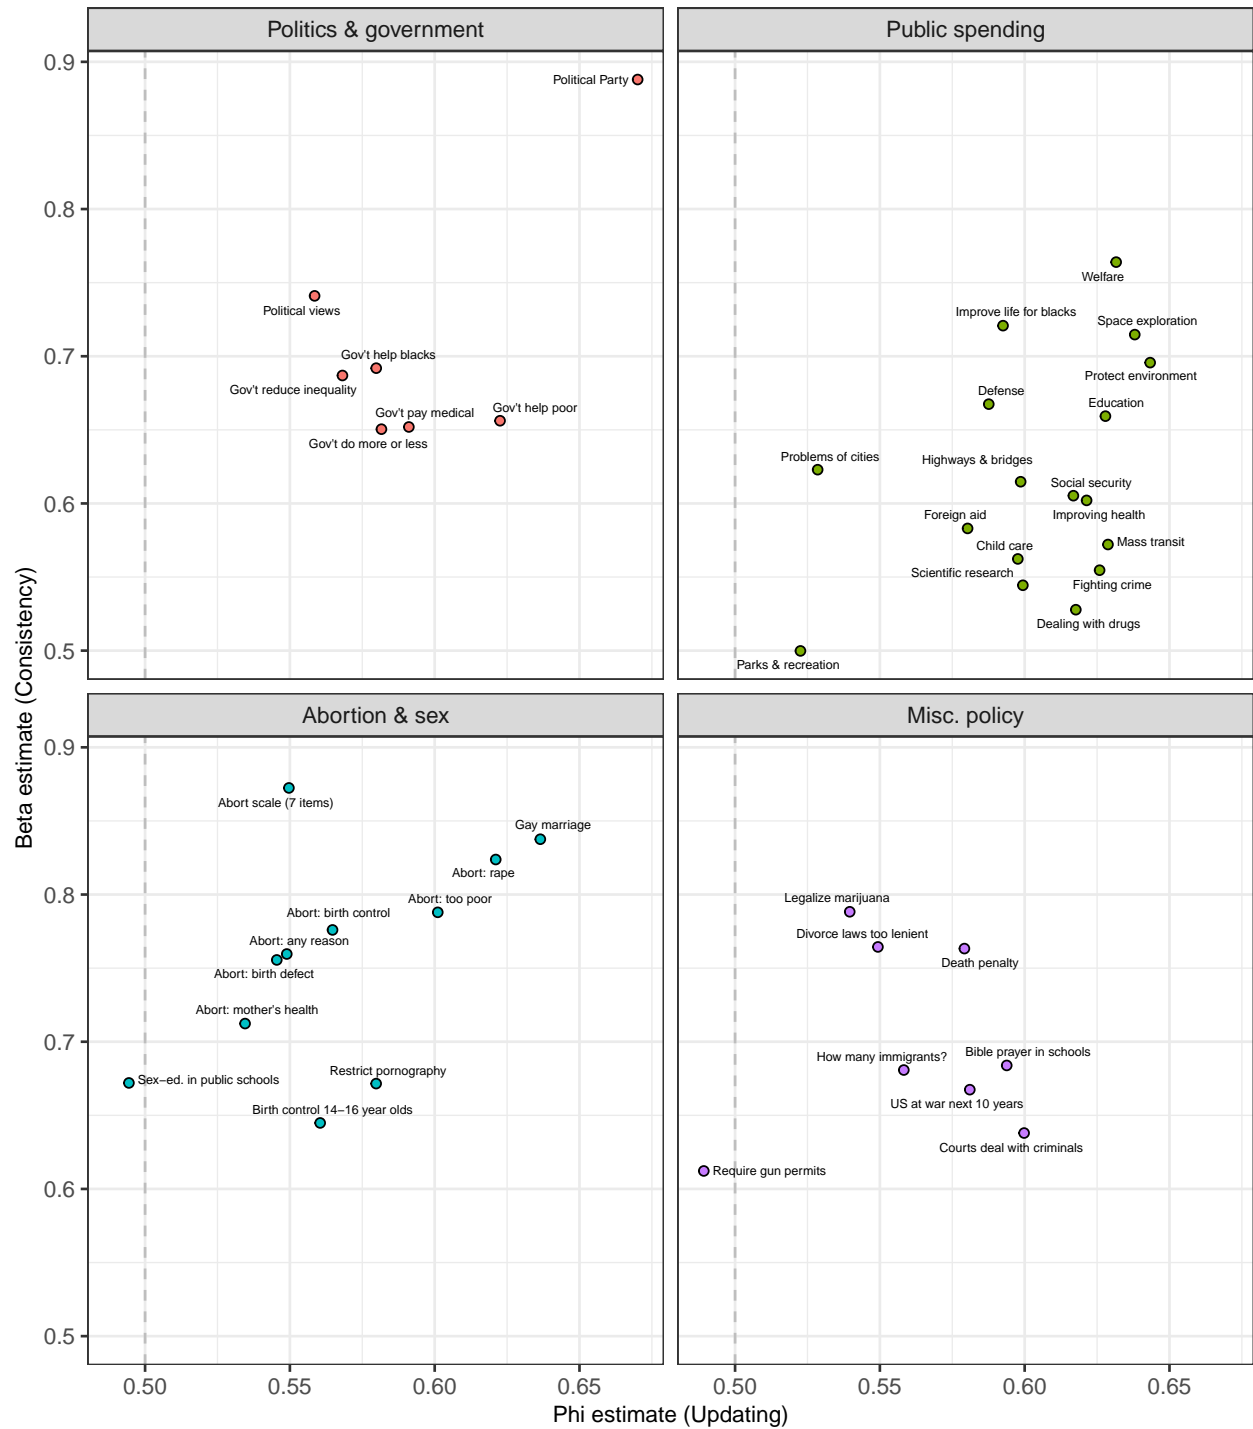

Figure 5: Phi (updating) and beta (consistency) estimates for 43 political attitudes and identities.

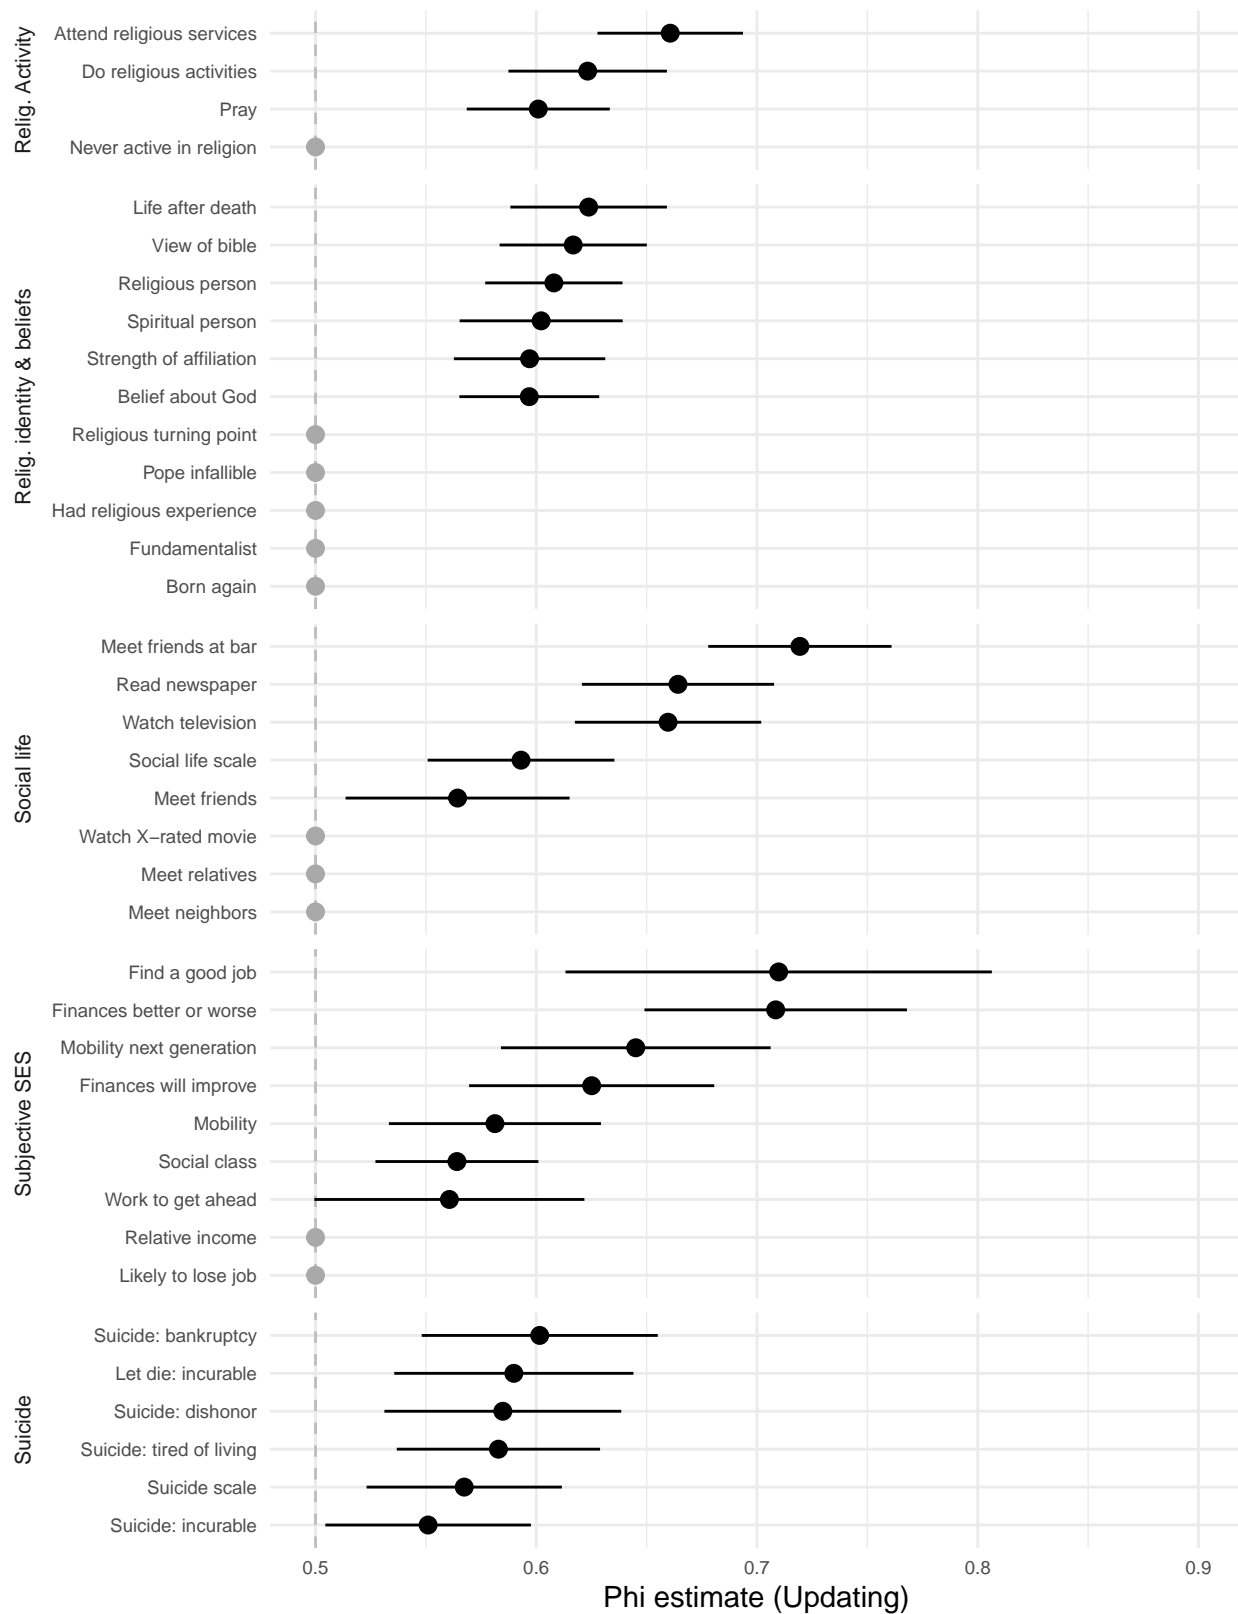

Figure 6: Phi estimates for items about religious activity and beliefs, social life, subjective SES, and suicide.

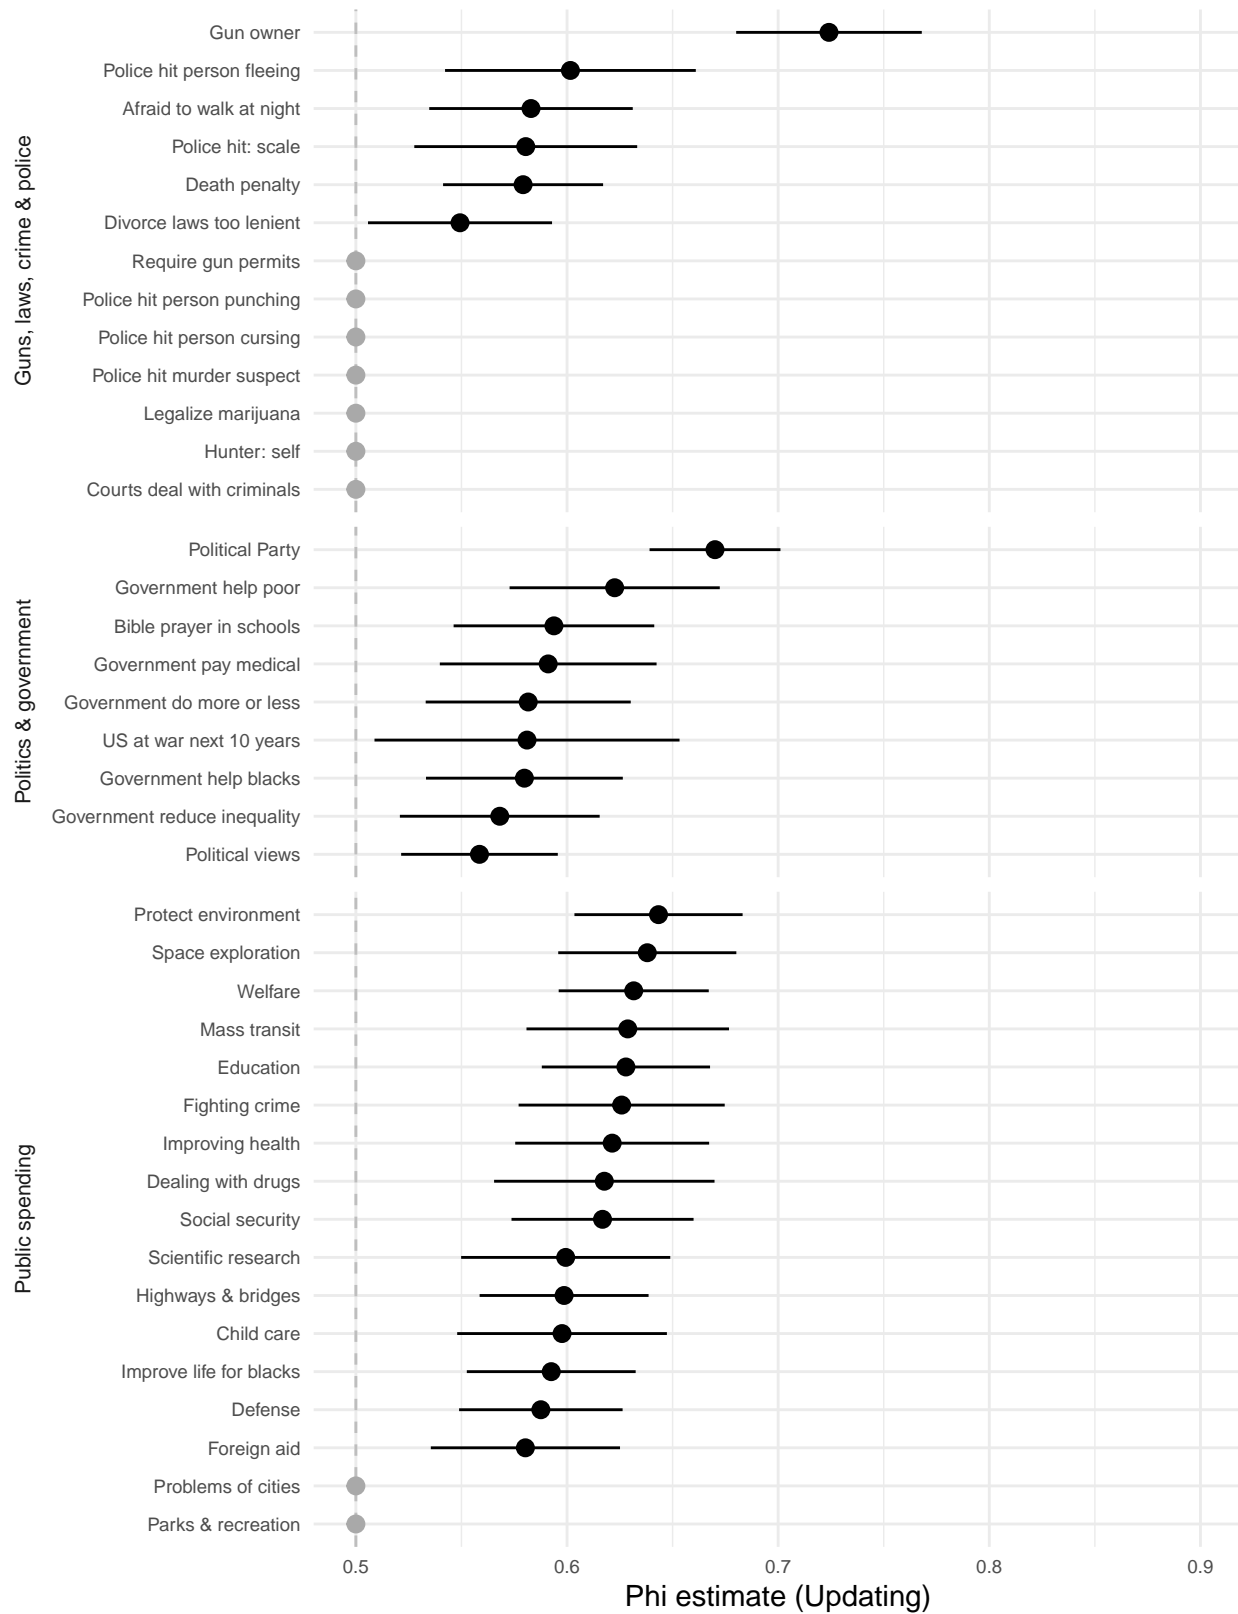

Figure 7: Phi estimates for items about guns, law, crime and policing; politics and government; and public spending. The item 'Police can hit citizens', which has  $\phi = .43$ , has been removed for ease of viewing

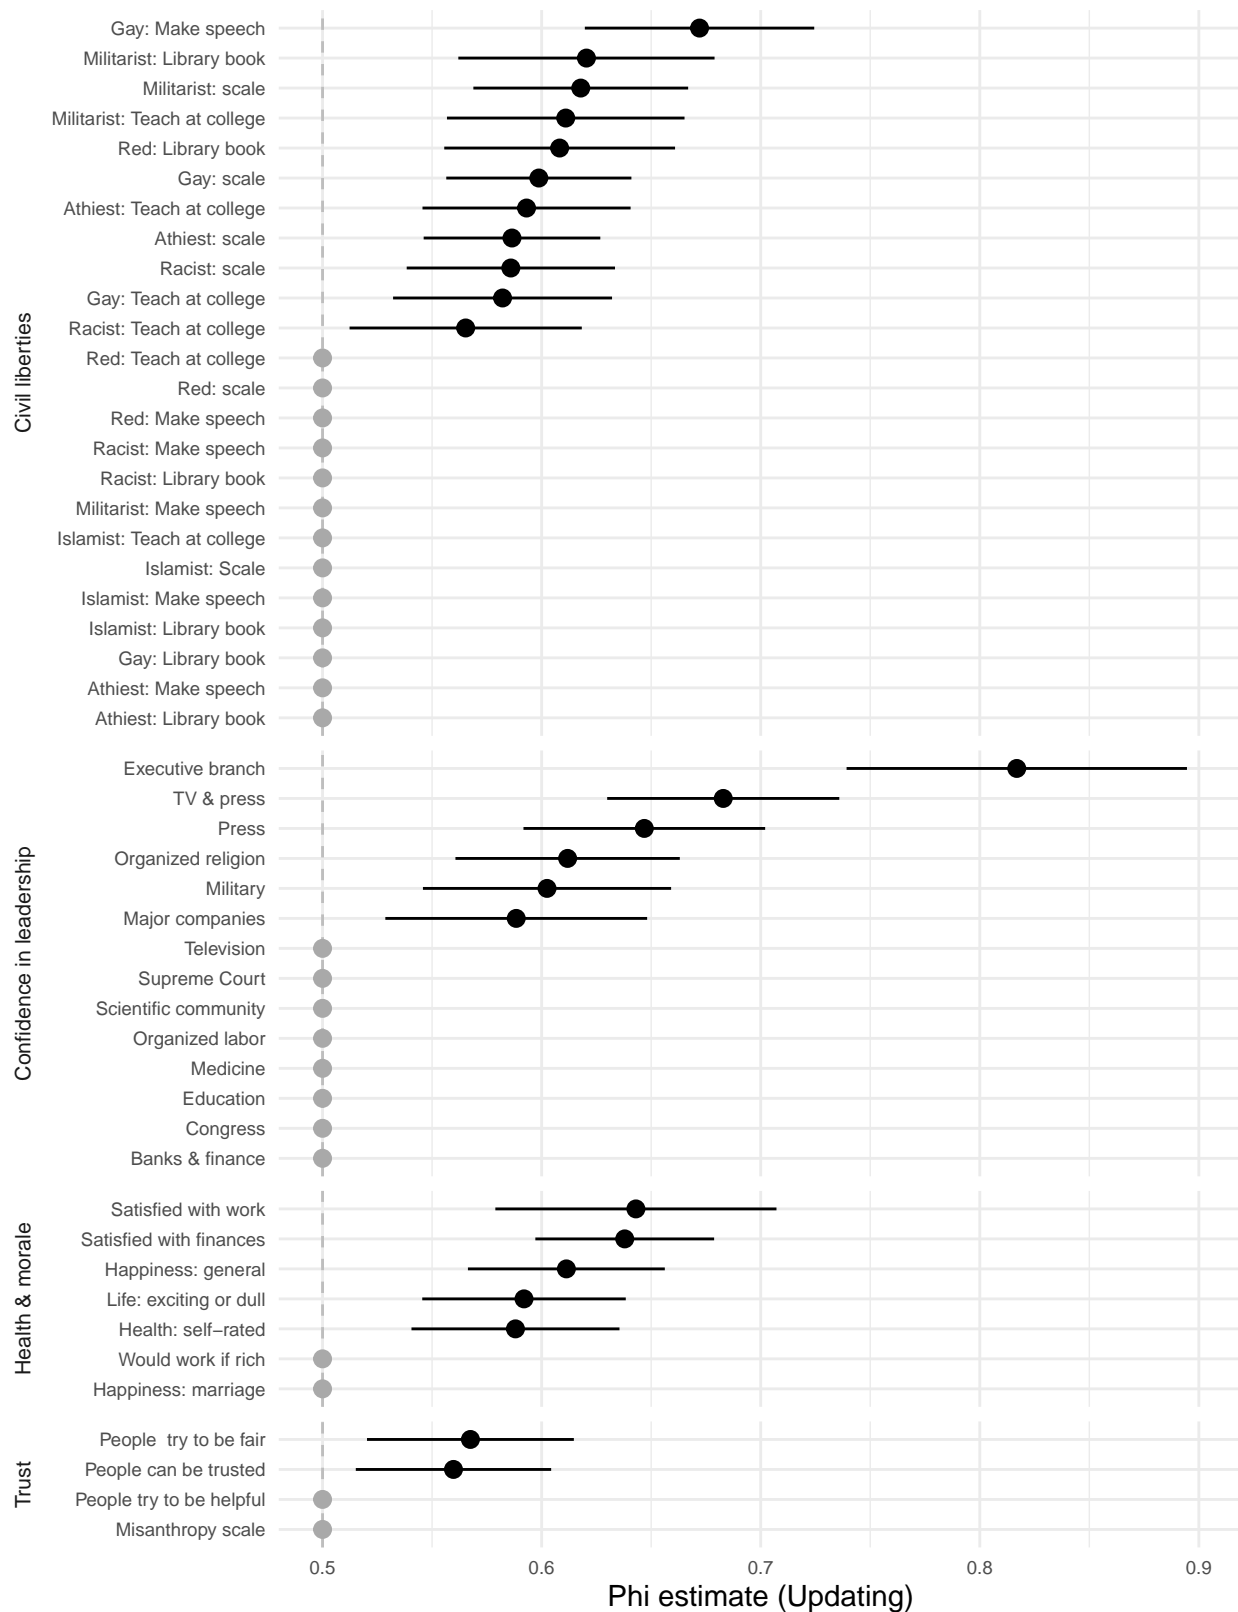

Figure 8: Phi estimates for items about civil liberties, confidence in leadership, health, morale, and social trust.

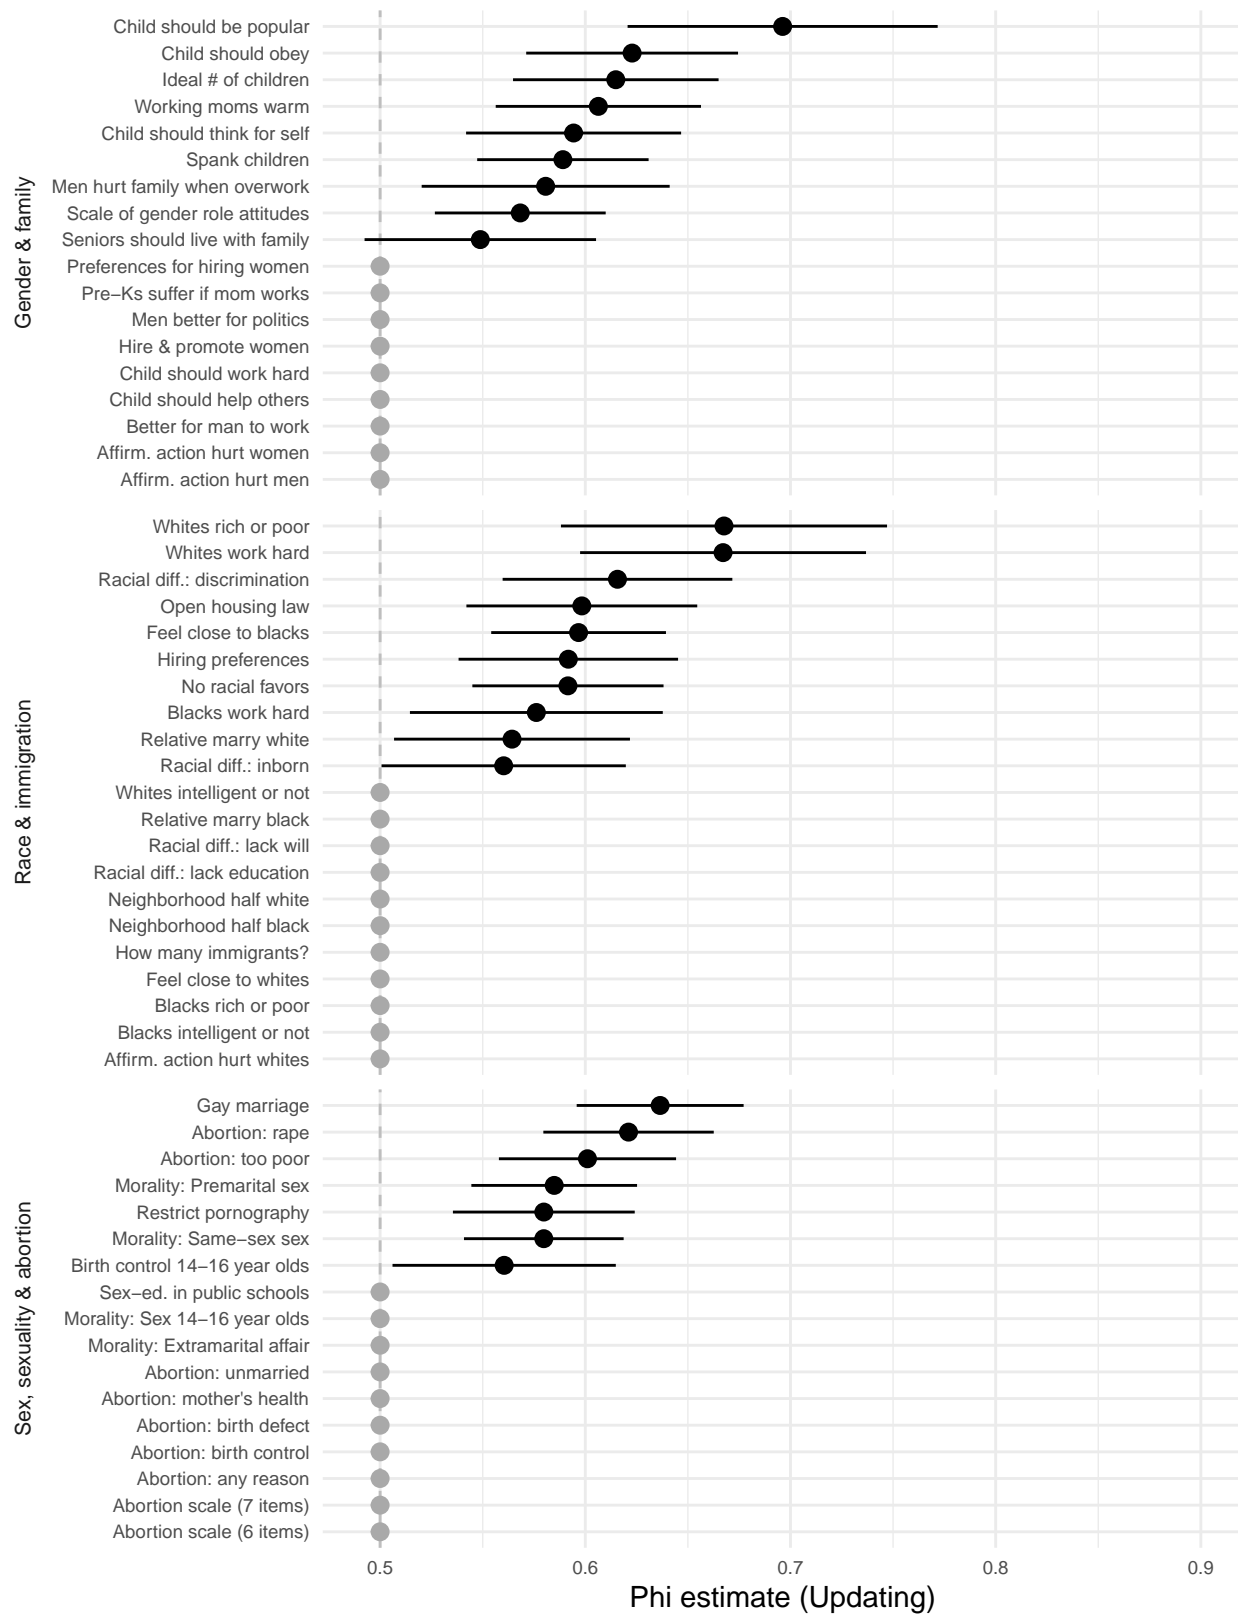

Figure 9: Phi estimates for items about race, gender, sex, sexuality, and abortion.
